DETAILED ACTION

Reason for Allowance

1. Claims 1, 4-11, 14-18, and 21-36 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Independent claims 1, 11, 18, 26, and 33 have been carefully considered.

Prior art of record fails to teach the combination of claimed elements including user-controllable graphics engine for creating a graphics scene in a television broadcast system; a template data element for representing a television broadcast frame; the template data element having a graphics component and a data field component; processing the template data element and an information unit source to enter in the data field component a selected information unit to form a representation of the graphics scene; generating a set of commands based on the representation of the graphics scene, the set of commands being executable by the graphics engine to create an on-air television broadcast frame.

Gill et al (US 6,081,262) discloses a multimedia presentation generation system that uses a multimedia authoring tool extension of a page based print document layout system to combine media objects of multiple diverse types into an integrated multimedia presentation.

Boyer et al (US 6,268,849 B1) discloses techniques for providing television program guide information and services with embedded real-time data to a user over the Internet. Dynamic information regarding events in progress may be provided to the web server; the dynamic information may be linked with related static information in the media library and/or the data server to provide the user with additional information pertaining to the events in progress.

Rohlfing et al (US 6,034,739) discloses a method and system for combining real scene elements from a television-type camera with virtual scene elements from a virtual camera. The system can be operated in real-time to produce real-time images. A database is created through the use of specialized virtual image generator control software.

Gordon et al (US 6,754,905 B2) discloses a method for providing an interactive electronic program guide for use in an interactive video information delivery system. The system combines the user of broadcast digital video streams with video-on-demand streams to produce audiovisual user interface. The system allows manipulation of a graphics overlay plane displayed in conjunction with a video image.

Okamura et al (US 6,701,524 B1) discloses a transmitting apparatus for an interactive communication system using a broadcast wave. The apparatus has a first storing unit for storing a plurality of frames of image data, and a second storing unit

for storing control information for each frame of image data. The apparatus converts HTML documents of the WWW server on the Internet into image data and control information for broadcasting.

Gill, Boyer, Rohlfing, Gordon and Okamura fail to teach or suggest generation of a set of commands based on the representation of the graphics scene, the commands being executable by the graphics engine to create an on-air television broadcast frame.

Conclusion

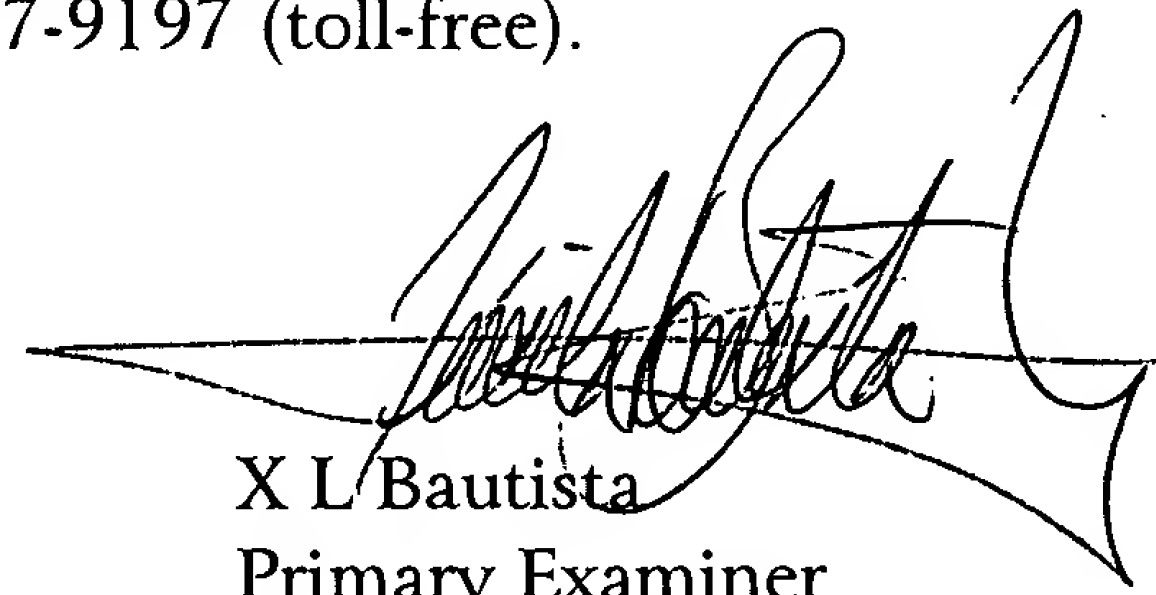

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
